

## **Network Backups**

### **Is your corporate and personal data backed up and secure in an offsite location?**

- 44% of all data loss is due to hardware failure or system malfunctions
- 32% of all data loss is due to human error
- 14% of all data loss is due to software corruption
- 7% of all data loss is due to viruses and other malware
- 3% of all data loss is due to natural disasters

### **What are network backups?**

Network Backups are securely transferred over the Internet to our facility and stored on one of our large secure servers. Integration is seamless and you configure what files are to be backed up and on what time schedule.

### **Why would I need backups?**

Your data is important. Would you want to lose all those years of memories, documents, financial data, emails, pictures, ... ?

Without a backup, in the event of hard drive failure, the only solution to recover your valuable data is to send the drive to a recovery specialist who would typically charge up to \$3,000 dollars to get back some of you data. This is very important, even if you didn't care about the costs, not all of your data will be recoverable!

### **I am concerned about security, is this secure?**

Yes! The data is well protected using up to 448bit encryption. It's more secure than most online banking institutions that typically use only 128bit or 256bit encryption.

## **How much does it cost?**

<b>Backup Storage Space</b>	<b>Cost per Month</b>
<b>5GB</b>	<b>\$15</b>
<b>10GB</b>	<b>\$25</b>
<b>\$2 per GB above 10GB</b>	

\*If you need more than 250GB we can design a custom solution that will save you money
